ABSTRACT

The species of spiders (Arachnida Araneae) found in the “Isola delle Femmine Nature Reserve” (Sicily, Italy) are reported here. The checklist provided is the result of some excursions carried out between 2021 and 2023 and aimed at studying the invertebrate fauna that lives on this small island. In total, up to date, 42 species, belonging to 38 genera and 19 families, are listed, among these *Diplostyla concolor* (Wider, 1834) is reported for the first time for Sicily.

KEY WORDS

Isola delle Femmine Nature Reserve; Spiderfauna; *Diplostyla concolor*.

Received 21.02.2024; accepted 13.04.2024; published online 30.06.2024

Proceedings of 6th International Congress on Biodiversity “Biodiversity and the new scenarios on alien species, climate, environment and energy” - Trapani (Italy, Sicily) 2–3 September 2022

INTRODUCTION

The present study is the result of a series of naturalistic excursions, held between 2021 and 2023, on the Isola delle Femmine Nature Reserve (Sicily, Italy) (Fig. 1), aimed at improving the state of knowledge on invertebrate fauna. Particularly, this study analyzes the data relating to the spider group (Arachnida Araneae) living in Isola delle Femmine. A first contribution to the knowledge of this population with a checklist of the sampled species and other faunal and biogeographic data are provided.

MATERIAL AND METHODS

Study area

Isola delle Femmine Nature Reserve (38°12'36

“N - 13°14'10” E) is located to the northwest of Sicily (Italy), near Palermo, along a stretch of coast between Capo Gallo and Punta Raisi, in the Gulf of Carini. A 2 meter deep and 400 meter long arm of sea separates the island from the mainland.

For a detailed description of this biotope see Caldarella et al. (2010), Sparacio et al. (2021) and Viviano et al. (2021).

Sampling

All samples were collected on sight on plants, under the rocks or in their web. They were taken in laboratory, treated with ethyl acetate and observed with binoculars for identification, stored in centrifuge tubes of different sizes, depending on the size of the sample, and were fixed in 75% ethanol (Levi, 1966). The samples are preserved in the A. Dentici collection (Palermo, Italy).

The chorotype is reported for each species. The chorological categories are based on La Greca (1962) subsequently elaborated by Vigna Taglianti et al. (1993, 1999) and Parenzan (1994):

ASE (Asiatic-European), ASM (Asiatic-Mediterranean), AME (African-Mediterranean), AWP (Afrotropical-W-Palearctic), CAE (Centrasian-European), CEM (Centrasian-European-Mediterranean), CME (Central Mediterranean), COS (Cosmopolitan), EUM (European-Mediterranean), EUR (European), ITE (Italian Endemic), MED (Mediterranean), OLA (Holartic), PAL (Palearctic), SCOS (Subcosmopolitan), SEU (South-European), TEM (Turanic-European-Mediterranean), TUM (Turanic-Mediterranea), WME (W-Mediterranean).

The classification, taxonomic order and nomenclatural arrangement for spiders follow Roberts (1995), Trotta (2004), Pantini & Isaia (2019), and World Spider Catalog (2024).

RESULTS

In total, 42 species, belonging to 38 genera and 19 families, are listed for this biotope; among these *Diplostyla concolor* (Wider, 1834), for which further biological and faunal data are provided, is reported for the first time for Sicily.
